

Port Vale Analysis Hub

IT setup guide - DNS configuration

Action required: one DNS A record

The Analysis department has deployed an internal football analysis platform for staff use (scouting, pre-match, post-match, squad planning, etc.). We require a single DNS record so staff can access the hub at a Port Vale subdomain.

1. DNS record required

Record type:	A
Host / name:	analysis
Full hostname:	analysis.port-vale.co.uk
Points to (IPv4):	178.128.161.215
TTL:	Default (e.g. 3600) - no special value needed

2. Where to add the record

Add the record wherever port-vale.co.uk DNS is currently managed:

- Cloudflare: DNS > Add record > Type A > Name analysis > IPv4 178.128.161.215
- Domain registrar or other DNS panel: same A record details as above

If using Cloudflare: set Proxy status to DNS only (grey cloud), not Proxied (orange cloud).

3. What IT does not need to do

- No hosting, VM, or server setup at the club
- No SSL certificate - handled automatically on our server after DNS is live
- No firewall changes, port forwarding, or internal network configuration
- No email or Microsoft 365 changes at this stage

4. How it works

Staff open the subdomain in Chrome. DNS resolves to our cloud server in London (DigitalOcean). The application is password-protected and for internal staff use only.

Staff browser -> analysis.port-vale.co.uk -> DNS A record -> 178.128.161.215
-> Analysis hub (password required)

5. Current status

Server:	Live and running at 178.128.161.215
Application:	Deployed and password-protected
DNS:	Waiting on A record (this request)
HTTPS on domain:	Enabled by Analysis team after DNS propagates

Until DNS is live, staff can use the temporary address <http://178.128.161.215/> (with login credentials provided separately by the Analysis team).

6. After the DNS record is added

- DNS propagation typically takes 15-60 minutes
- The Analysis team will enable HTTPS at <https://analysis.port-vale.co.uk>
- No further IT action should be required

7. Security summary

- Access is restricted by username and password
- Microsoft 365 single sign-on is planned as a future enhancement
- Impact API credentials are stored on the application server only
- Server: Ubuntu 24.04, Docker, London (DigitalOcean LON1)

Summary for IT

Please add an A record: analysis.port-vale.co.uk -> 178.128.161.215

If using Cloudflare, use DNS only (grey cloud).

Contact: Port Vale Analysis department for questions about the application.
